for efficient CodeIgniter development

Working with Models

Models are the backbone of data interaction in CodeIgniter. They encapsulate database operations, shielding the rest of the application from the complexities of SQL queries. A typical model might include methods for retrieving, inserting, updating, and deleting data.

```
php dbgetwhereusers
array(id return queryrowarray
```

This simple example demonstrates how to fetch a user from the users table. CodeIgniter's database library simplifies database interactions, making it easy to write efficient and secure database queries.

3 Building Views

Views are responsible for presenting data to the user. They are typically created as separate files, often with a .php extension, and use template engines or simple PHP code to render HTML. Data is passed from the Controller to the View using variables.

```
php Welcome
```

This example shows a simple view displaying a welcome message using a variable passed from the controller.

Managing Controllers

Controllers handle user requests and orchestrate the interaction between Models and Views. They receive user input, process it, interact with the database via Models, and then render the appropriate View to display the results.

```
URL routing maps incoming requests to specific controller methods
php loadviewwelcome data
```

This controller method loads the welcome view and passes the username variable.
